SCOR Working Group 168 Webinar #9

Title:

Chlorophyll-a update in BGC-Argo:
What's Changing in June 2026, How It Works, and Why It Matters?

Presenter:

Raphaëlle Sauzède
CNRS - Institut de la Mer de Villefranche

Chlorophyll-a concentration (Chla), a key indicator of phytoplankton biomass, is essential for understanding ocean ecosystems. While BGC-Argo floats have revolutionized global Chla monitoring, accurately converting fluorescence data into Chla estimates remains a significant challenge. In June 2026, a new real-time adjustment methodology will be implemented for Chla into the Argo data stream. This presentation will detail the methodology based on 4D-BGC products, the timeline for operationalization, and the broader implications of this update for ocean science and operational applications.

Webinar Series Information

The [4D-BGC Working Group](#) seeks to enhance access and utility of Biogeochemical (BGC) Argo observations through four-dimensional (4D) data products. These advanced data products aim to refine our understanding of ocean biogeochemistry, improve biogeochemical models and reanalysis products, and provide valuable insights for policy-making. The goal of this webinar series is to introduce new and in-development BGC data products, review techniques used to develop data products from in situ observations, and to explore ways in which 4D-BGC products are leveraged to answer scientific questions.
